ABSTRACT

The study aimed to identify if proper caregiving led to the development of the conscience and maintenance of the emotional stability of the orphans once they leave the orphanage. Descriptive correlational research design was used in this study. The study revealed that that conscience development of the orphans was high with an average weighted mean of 2.95, the level of emotional stability of the orphans was high with an average weighted mean of 3.06, the caregiving practices as perceived by the orphans was positive and they agreed that the caretakers advise them to avoid drinking alcohol with an average weighted mean of 3.06. Correlations indicated that there was a significant relationship between Conscience Development and Emotional Stability as well as Conscience Development and Caregiving Practices. The results also showed that there was a significant relationship between Emotional Stability and Caregiving Practices. The orphans who developed their moral development adjust well in terms of their affect. And the caregivers in the orphanage are responsible and provided the orphans the much needed psychological support for their total development.

Keywords: Descriptive correlational study, Conscience Development, Quantitative Research, Emotional Stability, Caregiving Practices.
